Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 16726; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

```
ô
sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers can be used in antisense therapy and in particularly full-length cDNas. The primers are useful for synthesising polynucleotides, particularly full-length cDNas. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNas. The primers allow obtaining of the full-length cDNas easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH13621 represent human amino acid sequences; and AAH13629 to AAH3621 represent colligonucleotides, all of which are used in the exemplification of the

                                                                                                                                                                                                                                       Gaps
                      lymph nodes are
(HS2) and/or HS132793 (HS3) for diagnosis and therapy of tumours, which their expression rates in tumour cells and/or lymph nodes ar determined. The EST sequences are useful as prognostic markers of survival of cancer patients (high levels of EST-related mRNA are associated with a poor prognosis, specifically correlated with adevelopment of metasrases); and for diagnosis and/or therapy of so tumours, particularly of colon, stomach and breast. The present seins a variant of the HS1 protein shown in the exemplification of the invention
                                                                                                                                                                                                                                       ..

blocking their expression.

Claim 10; Page 5; 10pp; German.

(DELB-) DELBRUECK CENT MOLEKULARE MEDIZIN MAX.

The present invention relates to the use of expressed sequence tags (ESTs), or variants, of the unigene cluster HS169395 (HS1), HS127144

```
regulated in specific cancers (e.g. about 1031 genes up-regulated in caute lymphocytic leukemia). ACC72641 to ACC72660 represent cancer related gene mucleotide sequences which encode the proteins given in ARR58721 to ARR58709. Also described: (1) determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising a nucleic acid molecule described above; (3) a host cell comprising the vector; (4) an isolated polypeptide, which is encoded by comprising the vector; (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a cherapeutic targets. In particular, the nucleic acid is useful for diagnosing a pathology, e.g. cancer (e.g. cancer of the bone marrow, bladder, brain, breast, cervix, colon/rectum, kidney, lung, ovary, pancreas, prostate, skin and uterus), wounds, ischaemia, heart diseases, atherosclerosis and endometriosis. The nucleic acid is also useful in a charm screening, particularly for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PSNGVPRSTAPGGIPNPEKKTNCETQCPNPQSLSSGPLTQKQNGLQTTEAKRDAKRMPAK 120

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to muclaic acid sequences over 99; identical with chroation also relates to muclaic acid sequences over 99; identical with invention also relates to muclaic acid sequences over 99; identical with crower board and a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of cidentifying a compound which binds to a polypeptide of the invention; and methods of invention further discloss methods of peventing, treating or ameliorating a medical condition; kits comprising polymucleotide probes and/or monotonal antibodies for carrying out the methods of the invention conting a medical condition; kits comprising polymucleotide probes and/or monotonal antibodies for carrying out the methods of the invention conting sequences corresponding to the cDNA sequences of the invention conting sequences corresponding to the cDNA sequences of the invention are expression or activity of the polymelede and/or polypeptide; and 767 conting sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the cheful in diagnostics, drug screening, forensics, gene mapping, in the dentification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are disease and other neurodegenerative diseases, anaemia, platelet concer. The nucleic acids may also be used as hybridisation products of sequence represents a specifically claimed human polypeptides sequence represents a specifically claimed human polypeptides equence of the invention. Note: The sequence of the invention. Note: The sequence of the polymel of the

leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
chronic myelogenous leukemia; prostate cancer; Brain and Acute Leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                               in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of characterizing acute myelogenous
                                                                                                                                                                                                                                                                                                                                                                                                               Characterizing acute or chronic myelogenous leukemia,

```

invention relates to a novel PTH responsive gene (PAIGB) fragment

Claim 9; SEQ ID NO 4; 169pp; English.

New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis.

Characterizing acute or chronic myelogenous leukemia, or prostate cancer in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.

Disclosure; SEQ ID NO 19; 78pp; English

The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAMLC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAMLC overexpression. This sequence corresponds to a BAMLC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.

New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. N-PSDB; AD048478

Claim 9; SEQ ID NO 8; 169pp; English.

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively in the isolated nucleic acid fragment operatively clinked to suitable regulatory sequences; a host cell transformed with the chaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a nucleic acid fragment the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; cereening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related disorders; evaluating the efficacy of a treatment of a bone related disorder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a bone evaluating the effectiveness of treatment of a bone forming to PAIGB; monitoring the effectiveness of treatment of a bone forming to PAIGB; monitoring the effectiveness of treatment of a bone evaluating to the paid to related agent; a transgenic animal comprising the DNA; an animal model

for the study of bone density modulation comprising a first group of
animals composed of the transgenic animal and a second group of
animals composed of the transgenic animal and a second group of
animals; studying bone mass determinants; studying the modulation of bone
composed of the state of the state of the state of the modulation of the
composed of the state of the st

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the linked to suitable regulatory sequences; a host cell transformed with the chaining a nucleic acid fragment encoding the polypeptide; amethod for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of ragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody determining whether an agent atters the expression of PAIGB gene or polypeptide; acreening agents for effectiveness in altering expression of the nucleic acid fragment, screening for agents useful for treating bone related disorders; evaluating the efficacy of a treatment of a bone related clisorder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a subject with a bone

correlated agent; a transgenic animal comportaing the DNA; an animal model for the study of bone density modulation comprising a first group of animals composed of the transgenic animal and a second group of control animals; studying bone mass determinants; studying the modulation of bone carriers of the starting bone related disorders; identifying whether an agent which has bone forming activity; and a stably transfected cell line comprising two constructs, the first construct comprising a ligand binding domain of linked to a DNA binding domain which is linked to an activation domain all of which expression is driven by a constitutive promoter, the second construct comprising multiple copies of DNA binding elements linked to a ninimal promoter which is linked to PAIGB Sune is induced. The PAIGB polynucleotide has osteopathic activity. The PTH responsive gene may be composition for diagnosing, treating or preventing bone related disorders, e.g., osteoprossis. This sequence represents a PTH creptonsive gene party.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The invention relates to a method of characterizing acute myelogenous leukemia (AMI) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AMI. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
Characterizing acute or chronic myelogenous leukemia, or prostate cancer in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.

Mao Y,

WPI; 2002-509506/55. N-PSDB; ADQ81901. New polypeptide human dioxygenase 10.12 and polynucleotides encoding this polypeptide, useful for treating various diseases, such as malignant tumors, inflammations, immunological diseases, hemopathy and HIV infection.

Claim 1; SEQ ID NO 2; 33pp; Chinese.

The present invention discloses a new kind of polypeptide, human

The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Characterizing acute or chronic myelogenous leukemia, or prostate cancer
dioxygenase 10.12, polynuclectides encoding this polypeptide, a DNA recombination process to produce the polypeptide and antagonist against the polypeptide. The present invention also discloses the method of applying the polypeptide in treating various diseases, such as malignant tumours, inflammations, immunological diseases, haemopathy and HIV infection. The present sequence is the human dioxygenase 10.12.
                                                                                                                                                                                                                                                                 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    myelogenous leukemia; prostate cancer; Brain and Acute Leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.

The methods kits and probes are useful for characterizing acute or Theoric myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Characterizing acute or chronic myelogenous leukemia, or prostate cancer in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.
                                                                                                                                                                                                                                                                                                                                        myelogenous leukemia; prostate cancer; Brain and Acute Leukemia;

```
The invention relates to a novel PTH responsive gene (PAIGB) fragment concluding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively construct comprising the isolated nucleic acid fragment operatively interest construct; a vector comprising the nucleic acid fragment; containing a polypeptide; a detecting the presence of the nucleic acid obtaining a nucleic acid fragment encoding the polypeptide; a method for cobtaining a polypeptide; a composition for regulating bone-forming activity of rangment an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity of a mammal comprising the nucleic acid fragment, polypeptide; a composition for regulating bone-forming activity of a resenting agents the expression of PAIGB mRNA; an agent that alters the expression of PAIGB mRNA; screening the effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related disorder in a subject; identifying polypeptides capable of binding to acid fragment; screening for agents useful for treatment of a bone related disorder; an authoring the effectiveness of treatment of a subject with a bone control and accord group of control animals composed of the transgenic animal comprising the DNA; an animal model for the study of bone density modulation comprising a first group of control animals; studying an effect of PAIGB on bone disorders; identifying an effect of FAIGB on bone disorders; identifying whether an agent which has bone forming activity, and a stably transfected cell linked to a DNA binding domain which is linked to an activation domain which has bone forming activity, and a stably where upon the addition animal producer, transcribing multiple copies of DNA binding elements linke to a minimal promoter which is linked to an activation and activity, and a composition of PAIGB only where upon the addition cofference and construct com
                                                                                                                                                                 bone density modulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. This sequence represents a PTH responsive gene protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis.
                                                                                                                                                        PTH responsive gene; PAIGB; bone-forming; bone; bone density modul transgenic animal; osteopathic; gene therapy; osteoporosis; human.
                                                                                                                 Human PTH responsive gene protein exon 2 splice variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stojanovic-Susulic V, Babij P,

The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Characterizing acute or chronic myelogenous leukemia, or prostate cancer in a patient comprises assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient.
                                                                                                                                                                                                                                                                                                                              acute myelogenous leukemia; gene expression; BAALC;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Hall, Linda M.
APPLICANT: Ren, Delian
APPLICANT: Dubald, Manuel Marcel Paul
TITLE OF INVENTION: Genes Encoding an Invertebrate Alphal
TITLE OF INVENTION: Calcium Channel Subunit
NUMBER OF SEQUENCES: 57
CORRESPONDENCE ADDRESS:
ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS, LLP
STREET: 699 Prince Street
CITY: Alexandria
STATE: VA
COUNTRY: USA
ZIP: 22314-3187
COMPUTER READBLE FORM:
MEDIUM TYPE: RIOPPY disk
COMPUTER: IBM PC compatible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6; Length 778;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       44; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PAPPLICANT: Miller, LOUIS H.; ADAMS, JOHN H.; KASLOW, JDAVIC C.; FANG, XIANGDONG TIALE OF INVENTION: DNA ENCODING PLASMODIUM VIVAX AND FLASMODIUM YOWLESI DUFFY RECEPTOR CURRENT APPLICATION DATA:

                                                                                                                                                                                                                                           Sequence 8115, Application US/09328352
Patent No. 6562958
GARREAL INFORMATION:
GAPPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BADMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: GTC99-03P8
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NOS: 8252
SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         54

Robinson JA, Stojanovic-Susulic V, Babij P, Murrills RJ; WPI; 2004-420299/39. N-PSDB; ADO48478. New nucleic acid fragment encoding a PAIGB polypeptide, useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis.

Claim 9; SEQ ID NO 8; 169pp; English.

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment; obtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide;

```
determining whether an agent alters the expression of PAIGB mRNA;

c screening agents for effectiveness in altering expression of the nucleic

screening agents for effectiveness in altering expression of the nucleic

disorders; evaluating the efficacy of a treatment of a bone related

disorders; evaluating the effectiveness of treatment of a bone related

disorders in a subject; identifying polypeptides capable of binding to

PAIGS; monitoring the effectiveness of treatment of a subject with a bone

cralted agent; a transgenic animal comprising a first group of

animals composed of the transgenic animal and a second group of control

animals; studying bone mass determinants; studying the modulation of bone

cmass; studying an effect of PAIGS on bone disorders; identifying an agent

cmass; studying an effect of PAIGS on bone disorders; identifying an agent

cmass; studying an effect of PAIGS on bone disorders; identifying an agent

constructs, the first construct comprising a linked to a lub b binding domain

clinked to a lub binding domain which is linked to a nactivation domain

clinked to a pub binding domain which is onstruct comprising multiple copies of DNA, binding elements linked to a

minimal promoter which is linked to PAIGB cDNA, where upon the addition

construct comprising multiple copies of DNA binding elements linked to

minimal promoter which is linked to PAIGB cDNA, where upon the addition

conference whereapy. The PTH responsive gene may be

conference accorders by gene therapy. The mucleic acid is useful in

created disorders, e.g., osteoporasis. This sequence represents a PTH

creaponsive gene protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SSNGVLRPAAPGGIANPEKKMNCGTQCPNSQNLSSGPLTQKQNGLWATEAKRDAKRMSAR 120

The invention relates to a novel PTH responsive gene (PAIGB) fragment construct comprising the isolated nucleic acid fragment operatively construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the construct construct; a vector comprising the nucleic acid fragment obtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a nucleic acid fragment encoding the polypeptide; a method for chamming a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; composition for regulating bone-forming activity in a mannal comprising the nucleic acid fragment, polypeptide; or a mannal comprising the nucleic acid fragment; an antibody consent alters the expression of PAIGB gene or polypeptide; and gent that alters the expression of PAIGB gene or polypeptide; and gent that alters the expression of PAIGB gene or polypeptide; and gent that alters the expression of PAIGB menuleic caid fragment; screening for agents useful for treating bone related disorder in a subject; identifying polypeptides capable of binding to disorder; evaluating the efficacy of a treatment of a subject with a bone related agent, a transgenic animal comprising the DNA; an animal model for the study become mass determinants; studying the modulation of bone mass determinants; studying the modulation of bone mass determinants; studying the modulation of bone mass; studying an effect of PAIGB on bone disorders; identifying an activation domain of the study of bone density and a stably transfected cell line comprising multiple copies of DNA binding elements linked to a DNA binding domain which is linked to an activation domain construct, comprising multiple copies of DNA binding elements linked to an activation domain along the promocer which is linked to a post the addition of PAIGB gene therapy. The PTH responsive gene may be preparing a composition for diagnosin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide comprisentary to the
complementary strand of a polynucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
oligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
complementary strand of a polynucleotide which comprises a 5'-end
complementary strand of a polynucleotide which comprises a for end sequence complementary to a
complementary strand of a polynucleotide which comprises a 5'-end sequence in a oligonucleotide comprises a 1'-end sequence, where the
complementary the primer sets can be used in antisense therapy and in
cypecification. The primer sets can be used in antisense therapy and in
cypecification. The primer sets can be used in antisense therapy and in
cypecification and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
complementary strand or diagnosis of the abnormality of the proteins encoded
condagance and any specialised methods. AAH03166 to AAH13628 and
AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         solid
The present invention relates to the use of expressed sequence tags (ESTS), or variants, of the unigene cluster HS169395 (HS1), HS127144 (HS2) and/or HS132793 (HS3) for diagnosis and therapy of tumours, in which their expression rates in tumour cells and/or lymph nodes are determined. The EST sequences are useful as prognostic markers of survival of cancer patients (high levels of EST-related mRNA are associated with a poor prognosis, specifically correlated with development of metastases); and for diagnosis and/or therapy of solid tumours, particularly of colon, stomach and breast. The present seque is a variant of the HS1 protein shown in the exemplification of the

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-cegulated in specific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72660 represent cancer calated gene nucleotide sequences which encode the proteins given in ABRSBS231 to ABRSB709. Also described: [1] determining the presence or absence of a pathological cell in a patient; (2) an expression vector comprising the vector; (4) an isolated polypeptide, which is encoded by the nucleic acid, (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by administering to the patient the antibody above; and (7) a patient by abhology, e.g. cancer (e.g. cancer of the bone marrow, colon/rectors, brain, breast, cervix, colon/rectormin, ischaemia, heart diseases, cervix, colon/rectormin, ischaemia, heart diseases, carrier of drug screening, particularly for identifying agents for treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 SSNGVLRPAAPGGIANPEKKMNCGTQCPNSQNLSSGPLTQKQNGLWATEAKRDAKRMSAR 120

```

The invention relates to 971 novel human cDNA sequences (ADC29919-CADC3088) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the nucleic acid sequences over 99% identical with the nucleic acid of the invention; the crombinant production of a polypeptide of the invention; an antibody companies a polypeptide of the invention; an antibody compound which binds to a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention is amethods of perenting, treating or ameliorating a medical condition; kits computising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention invention methods for the identification of compounds that modulate the cypression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the colly sequences of the invention (ADC33394). The nucleic acids and polypeptides of the invention are textual in diagnostics, drug screening, forensics, gene mapping, in the contig for the invention are consecuted by the contigs (ADC33394). The nucleic acids and polypeptides of the invention are consecuted by the contigs (ADC33394). The nucleic acids and polypeptides of discases, Alzheimer's also used for treating diseases such as Parkinson's diseases or other caracting diseases such as Parkinson's diseases or cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids may also be used as hybridisation probes or concer. The nucleic acids ma

                                                                                                                                                                                                                                                   are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                  9
                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               myelogenous leukemia; prostate cancer; Brain and Acute Leukemia;

```

The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful

```
The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric consprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the chimeric construct, a vector comprising the nucleic acid fragment; obtaining a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid cragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity; in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; determining whether an agent alters the expression of PAIGB mRNA; careening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related
                                                                                                                                                    ö
for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                            SSNGVLRPAAPGGIANPEKKMNCGTQCPNSQNLSSGPLTQKQNGLWATEAKRDAKRMSAR 120

Liberiners; evaluating the effectiveness of treatment of a bone classical disponder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a subject with a bone crelated agent; a transgenic animal comprising the DNA; an animal model of or the study of bone density modulation comprising a first group of animals composed of the transgenic animal and a second group of control animals composed of the transgenic animal and a second group of control animals; studying bone mass determinants; studying the modulation of bone cass; studying an effect of PAIGB on bone disorders; identifying whether an agent to for treating bone related disorders; identifying whether an agent which has bone forming activity; and a stably transfected cell line comprising two constructs, the first construct comprising a ligand binding domain cellinked to a DNA binding domain which is linked to an activation domain all of which expression is driven by a constitutive promoter, the second construct comprising multiple copies of DNA, where upon the addition of chemical inducer, transcription of PAIGB gene is induced. The PAIGB polynucleotide has osteopathic activity. The PTH responsive gene may be used to treat disorders by gene therapy. The nucleic acid is useful in preparating a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. This sequence represents a PTH responsive gene protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               145
                                                                                                                              The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 KIKAPTDSVSDEGLFSASKWAPLAVFSHCMLEDGLPSNGVPRSTAPGGIPNPEKKTNCET 120

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprising the nucleic acid fragment; cobtaining a pulypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of fragment; an antibody that specifically binds to one or more epitopes of fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; determining whether an agent alters the expression of PAIGB mRNA; screening agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treating bone related
                                                                                                                                                                                                                                                                                                                           45 GPEAGGLHAGVLEDGLSSNGVLRPAAPGGIANPEKKMNCGTQCPNSQNLSSGPLTQKQNG 104
     dioxygenase 10.12, polynucleotides encoding this polypeptide, a DNA recombination process to produce the polypeptide and antagonist against the polypeptide. The present invention also discloses the method of applying the polypeptide in treating various diseases, such as malignant tumours, inflammations, immunological diseases, haemopathy and HIV infection. The present sequence is the human dioxygenase 10.12.

                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                      The invention relates to a method of characterizing acute myelogenous leukemia (AML) in a patient by assaying for the overexpression of one or more BAALC transcripts in cells obtained from the patient, where an overexpression indicates that the patient has an aggressive form of AML. The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.

The methods, kits and probes are useful for characterizing acute or chronic myelogenous leukemia, or prostate cancer. They are also useful for detecting BAALC overexpression. This sequence corresponds to a BAALC (Brain and Acute Leukemia, Cytoplasmic) protein encoded by an alternative spliced RNA consisting of exons 1, 6 and 8.

The invention relates to a novel PTH responsive gene (PAIGB) fragment encoding a polypeptide. The invention further comprises: a chimeric construct comprising the isolated nucleic acid fragment operatively linked to suitable regulatory sequences; a host cell transformed with the linked to suitable regulatory sequences; a host cell transformed with the chimeric construct; a vector comprishing the nucleic acid fragment; containing a nucleic acid fragment encoding the polypeptide; a method for obtaining a polypeptide; detecting the presence of the nucleic acid fragment; an antibody that specifically binds to one or more epitopes of a PAIGB polypeptide; a composition for regulating bone-forming activity in a mammal comprising the nucleic acid fragment, polypeptide or antibody; an agent that alters the expression of PAIGB gene or polypeptide; determining whether an agent alters the expression of PAIGB mRNA; correning agents for effectiveness in altering expression of the nucleic acid fragment; screening for agents useful for treatment of a bone related disorders; evaluating the effectiveness of treatment of a bone related clisorder in a subject; identifying polypeptides capable of binding to PAIGB; monitoring the effectiveness of treatment of a bone ralated correlated agent: a transcoric animal comression the bone ariant and presented agents.

related agent, a transgenic animal comprising the DNA, an animal model for the study of bone density modulation comprising a first group of animals composed of the transgenic animal and a second group of control animals; studying bone mass determinants; studying the modulation of bone mass; studying an effect of PAIGB on bone disorders; identifying an agent for treating bone related disorders; identifying whether an agent which has bone forming activity; and a stably transfected cell line comprising two constructs, the first construct comprising a ligand binding domain linked to a DNA binding domain which is linked to an activation domain

all of which expression is driven by a constitutive promoter, the second construct comprising multiple copies of DNA binding elements linked to a minimal promoter which is linked to PAIGB CONA, where upon the addition of chemical inducer, transcription of PAIGB gene is induced. The PAIGB polynucleotide has osteopathic activity. The PTH responsive gene may be used to treat disorders by gene therapy. The nucleic acid is useful in preparing a composition for diagnosing, treating or preventing bone related disorders, e.g., osteoporosis. This sequence represents a PTH responsive gene protein of the invention.
